

FORECAST

TRAFFIC WEATHER -1°

SALT / BRINE  
5 g/m<sup>2</sup>

INNOVATION

Adopt a disruptive winter maintenance solution to reduce salt use, ensure road safety, and minimize environmental impact.

## Reduce costs

Lower your salt and brine usage with our advanced algorithm, which analyzes road and weather conditions to accurately predict real-time residual salt levels on the roadway.

Get a complete overview of residual salt across your entire road network.

## Increase efficiency

Monitor in real-time residual salt levels on every road and confidently decide when to apply more material or adapt your ongoing workflows.

## Manufacturer-independent solution

Our solution applies to spreaders, briners and combined machines, whether mounted or towed. It is independent of the manufacturer.

## Benefit from advanced features

Forecast is linked to our ProVOIRIE service, which delivers geolocation data and real-time status of any activity type (spreading quantities / snow plow, mowing, etc.).

When linked with ProvaTHERMO (which recommends the appropriate salt / brine treatment), you can infer the remaining salt on the road based on the suggested treatment.
